Field forms	63

1. Background

According to the FAO, Tree outside Forest (TOF) include all trees and tree systems outside forests, contributing significantly to the overall tree cover of a region. TOF plays a vital role in carbon sequestration, livelihood support, biodiversity conservation, and soil conservation. Despite their significance, detailed data and information on TOF remain unavailable. To address this gap, FRTC has planned a program to assess tree species located outside forest areas.

2. Instruments

The instruments needed to carry out resource assessment of trees outside forests are listed in annex I

3. Field Measurements and Techniques

Plot level data

Date

Date of the measurement day according to English calendar in the form of 'day/month/year', i.e. *dd/mm/yyyy* (e.g. 23/10/2024 or 05/02/2024).

Crew leader

Crew leader is identified by writing his/her full last name and the first names (e.g. Giri Rajkumar).

Name of Local Level / Ward No.

Name of local level (gaupalika or nagarpalika) is written here with ward number

FAO_land_use_class

FAO land use class 1 field should be filled using the FAO land use class 2 data in previous FRA and has following codes;

1. **Forest land.** The crown cover of the stand exceeds 10 % as it grows towards maturity. Trees are able to reach the height of 5 meters. The size and minimum width of the forest stand must be greater than or equal to 0.5 hectares and 20 m, respectively.
2. **Other wooded land.** In maturity the height of trees is at least 5 meters and crown cover 5–10 %, or the crown cover of trees and shrubs exceeds 10 %. Shrubs are usually more than 0.5 m and less than 5 m high multi-perennial, usually multi-stemmed woody plants. Other wooded land must exceed 0.5 hectares in size and 20 meters in width.

Agricultural land

3. Agricultural land with tree cover; must fulfil the forest criteria (CC> 10%, minimum width 20 m and area 0.5 ha) Note: agriculture land with scattered trees is not included in this class if the crown cover is less than 10 %.
4. Agricultural land not fulfilling the forest criteria

Built-up land

5. **Built-up land** with tree cover, must fulfil the forest criteria (CC> 10%, width 20 m, area 0.5 ha)
6. **Built-up land** not fulfilling the forest criteria
7. **Roads.** Minimum width of roads is 15 m (from outer side of ditch to the outer side of the other ditch); roads with lesser width are included in the surrounding land use class.
8. **Other land, including ice, grass land etc.**
9. **Water** Area covered by major rivers, lakes and reservoirs.

Forest/Location name

As local people explain the specific name of the forest or location where the plot is located. (for example- Gairikhola forest, Mathillo ban, Rani ban etc.).

Aspect in degrees (001-360°)

Direction of the main gradient of the slope. It is determined from the plot centre to the direction of the main gradient (downhill) and taking a bussle (compass) reading in degrees (001-360). For flat land (slope=0) write 0.

Slope, percent

Average gradient of plot is determined at the plot centre by taking uphill and downhill measurements with the hypsometer. The slope gradient is the average of the two readings. The assessment is limited to the plot area, i.e. the radius (20 m). Recording unit is in percent, i.e. 45 degrees equals to 100 percent.

Altitude in metres

Altitude of the plot above the mean sea level in metres. Altitude will be recorded in field.

Macro-topography

Classify the location of the plot according to the following codes (see **Figure 1**):

- 1 Valley
- 2 Ridge
- 3 Upper part of the slope
- 4 Middle part of the slope
- 5 Lower part of the slope
- 6 Plain (Slope is less than 10 %).

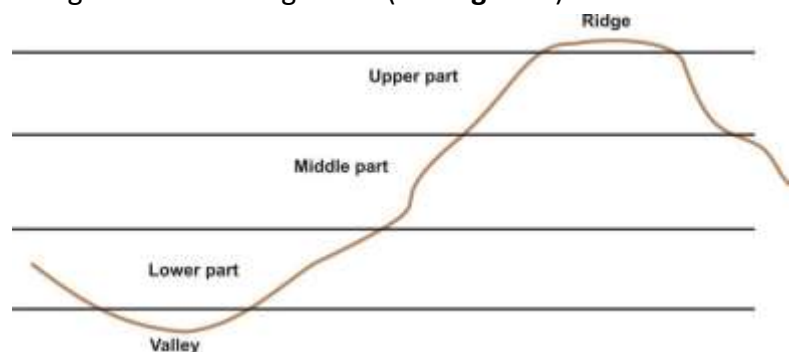

Figure 1. Illustration of classes used to determine macro-topographic location of the sample plot.

Stand level data

Stand delineation

The plot should be delineated into two or more stands if there exist more than a single forest type or land use within the plot area. In such cases, a clear stand delineation is required for estimating areas respective to different stands (e.g. natural forest stand and plantation forest stand) or land use classes (e.g. forest, cropland, grassland, canal/river plantation, urban trees, homestead, etc.), e.g. figure (2).

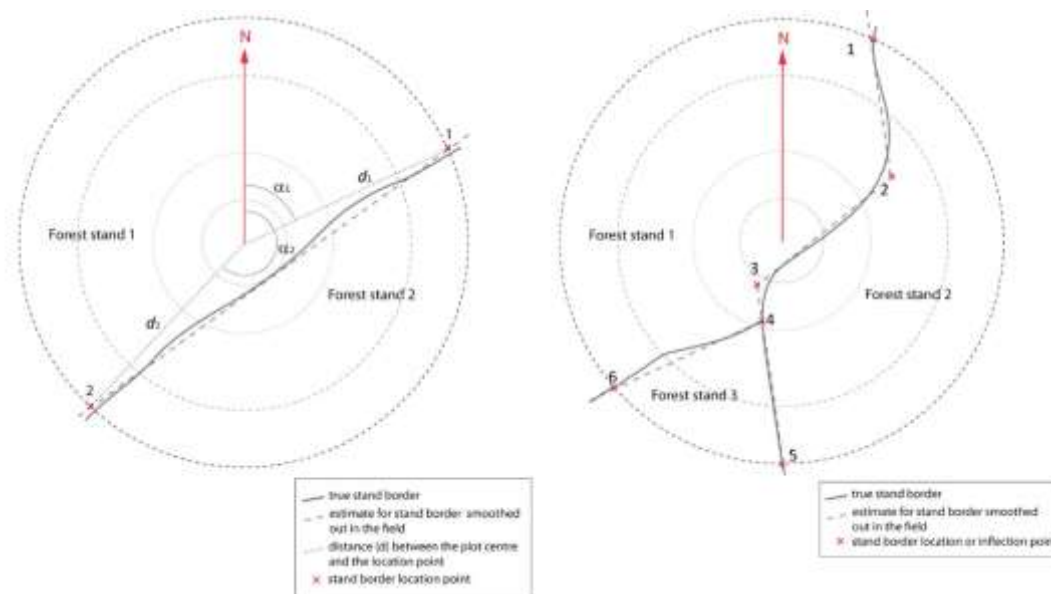

Figure 2. Stand delineation techniques

Reachability

Reachability of the plot determined in the field. Plot is regarded as non-reachable, if the crew could not access the plot due to various reasons such as inaccessible way, dense grasses, some restrictive area, river moved to the plot etc.

- 0 - Plot non-reachable Plot is regarded as non-reachable if crew could not access the plot due to any reason.
- 1 - Plot reachable but surrounded by inaccessible area
- 2 - Plot reachable

ToF types

Data on tree outside forests' type should be recorded in the following way:

- 1 Cropland
- 2 Homestead / Home garden
- 3 Roadside plantation
- 4 Canal / River side plantation
- 5 Trees in private premises (e.g. inside office and residence compound area)

Strata

1. agriculture
2. settlement
3. road/canal/river, and
4. public land/park

Forest Type (only if applicable)

Forest types (only if applicable) should be recorded as mentioned below:

A	Abies Forest	<i>Abies spectabilis</i>
Bu	Betula Forest	<i>Betula utilis</i>
Ce	Deodar Forest	<i>Cedrus deodara</i>
Ct	Cupressus Forest	<i>Cupressus torulosa</i>
Jw	Juniper Forest	<i>Juniperus wallichiana</i>
KS/SK	Khair Sissoo Forest	<i>Acacia catechu, Dalbergia sissoo</i>
Pr	Khote Salla Forest	<i>Pinus roxburghii</i>
Pw	Gobre Salla Forest	<i>Pinus wallichiana</i>
Q	Quercus Forest	<i>Quercus spp.</i>
S	Sal Forest	<i>Shorea robusta</i>
Sp	Spruce Forest	<i>Picea smithiana</i>
Td	Hemlock Forest	<i>Tsuga dumosa</i>
TMH	Terai Mixed Hardwood	<i>Mixed Species at < 1000m altitude</i>
LMH	Lower Mixed Hardwood	<i>Mixed Species between 1000m - 2000m</i>
UMH	Upper Mixed Hardwood	<i>Mixed Species at > 2000m altitude</i>
SB	Shrub	<i>Shrub Species</i>

Pure forest type will be used if the basal area of the dominant species is more than 60 %. If none of the species exceeds 60 % but exceeds 33 %, the forest type will be considered as mixed type. If there are two species each exceeding 33 %, the forest type will be considered as mixed forest of the two species and coded as a combination of them (e.g. Q/Pr). If the first species is more than 33 % and the second species less than 33 % the forest type will be considered as the mixed type of the dominant species and mixed type, e.g. Q/LMH. If none of the species exceed 33 %, the forest type will be considered as mixed (TMH, LMH, and UMH).

Origin

1. Plantation forest
2. Naturally regenerated forest

Development status

Developmental status is recorded based on the average size of trees dominant in the forest stand. Following codes are used to classify the development status;

- 1 **Seedling and Sapling stand.** A stand comprised of trees with diameter at breast height less than 12.5cm and not qualified as pole timber or saw timber.

2 Pole timber stand. A stand with majority of basal area is occupied by trees of 12.5 cm–25 cm DBH.

3 Small saw timber stand. A stand with majority of basal area is occupied by trees of 25 cm–50 cm DBH.

4 Large saw timber stand. A stand with majority of basal area is occupied by trees of 50 cm or more DBH.

Crown cover, percent

Crown cover is determined by estimating or measuring the area of ground covered by tree canopies, ignoring overlap and gaps within individual canopies. Spherical densiometer is used to measure the crown cover.

Crown cover measurements are implemented at five points in a plot, i.e. at the plot centre and at the cardinal points (N, E, S and W), facing towards the plot centre using a spherical densiometer.

$$\text{Crown cover \%} = (\text{Total readings from 5 points} \times 100) / 45$$

Tree level data

Number of enumerated trees

Number one is given for the first tallied tree on each plot, and the numbering continues without interruption up to the last tree tallied (**Field form 3**). Stumps and dead standing trees are also numbered along with living tally trees.

Forest stand

It is the stand number (for plots with multiple stands) where the tree lies. The number must equal to the numbering applied in the stand description and the sketch. The stand of each tree should be clearly mentioned in this column.

Bearing in degrees (001-360°)

The bearing from the plot centre to the middle of the stem at base of the tree. Recording unit is degree (001/360).

Distance in metres (with one decimal)

The horizontal distance from the plot centre to the centre of the tree trunk at the base of the tree. Recording units are meters up to one decimal e.g. 5 meters 20 centimeters is recorded as '5.2'. If the distance is in absolute figure, 0 should be mentioned in decimal. For example, 5m distance should be written as 5.0 m.

Species Code

Tree species is recorded by codes for each tallied tree on the sample plot. The list of species-specific codes is presented in **Annex II**.

Species Name

The species names for all trees should be recorded here.

(DBH) Diameter in centimetres (with one decimal)

Diameter at breast height is measured at 1.3 m above the ground level for the standing tally trees. When the ground level cannot be defined, the breast height is determined from the seeding point. If the trunk is deformed at breast height, the diameter is measured from the nearest (above or below the breast height) well-formed point of the stem. When the measuring point for diameter at breast height differs from 1.3 m, the measuring height should be written at remarks (e.g. "DBH measured at the height of 1.5 m").

Tree quality class

Tree quality is based on the present or prospective form, roughness and soundness of a tree. For a tree with exploitable diameter, observation is based on its present condition. For smaller trees the quality class should be assessed based on their expected ability to reach exploitable size. Tree quality classes should be recorded using the following codes:

- 1 High quality sound tree.** A tree with good form and now or prospectively having a length of at least 6 m in sound saw logs.
- 2 Sound tree.** A sound tree not qualified in the class 1. The tree must have now or prospectively at least one 3 m section of saw log or two 1.8 m or longer saw log sections.
- 3. Cull tree.** A tree having poor form, roughness, injury or decay stem and that does not (now or in the future) yield logs of merchantable quality. Climbers are also included in this class.
(All trees not included in class 1 and 2)

Crown class

Crown class is determined by tree heights and depends on the size and condition of the crown of the tree and its position in relation to other trees in the forest stand. Crown class (1-5) should denote the condition of receiving light from sunlight and crown class (6-9) should represent the condition/nature of the tree.

- 1 Dominant.** A tree with a larger crown than the average size in or above the level of the surrounding canopy and receiving full light from above and more than one side.

- 2 Co-dominant.** A tree with a medium-sized crown in the level of the general canopy and receiving fulllight from above and at least on side.
- 3 Intermediate.** A tree with a smaller crown than the average, reaching the general level of the canopy but not above it and receiving some direct light from above but little if any from the side.
- 4 Suppressed.** A tree with a crown that is smaller than what is normal to a tree of this age and size. The tree is receiving little or no direct sunlight and showing signs of retarded growth resulting from the competition of dominant trees.
- 5 Understory.** A tree with a crown that is below the level of the general canopy layer. Receiving little or no direct sunlight, but not showing signs of suppression or retarded growth. Such trees may be tolerant to shade. Or saplings not yet seriously affected by the competition of other vegetation.
- 6 Broken.** A tree of which the top or trunk is cut or naturally broken.
- 7 Dead usable.** A dead tree that can be used as fire wood, for instance.
- 8 Dead unusable.** A tree is dead or it is expected that the tree will die during the growing season.
- 9 Stump.** A cut or broken tree with height less than 1.3 m

Tree height

The height of a tree is measured with the help of Vertex IV and Transponder T3. Transponder height had been calibrated to 1.3m, thus this should be checked and verified during the measurements. Special attention is needed in a slope where the height from the tree base and transponder may not be exactly 1.3m. In such condition the differences should be noticed and adjusted to derive the total height of tree (figure 3).

Base in metres of leaning tree

The base distance is measured in meters with one decimal. Tree base is the horizontal distance from the centre of the tree stump to the ground projected tip of the leaning tree and projected point of the tip at the ground (figure 3).

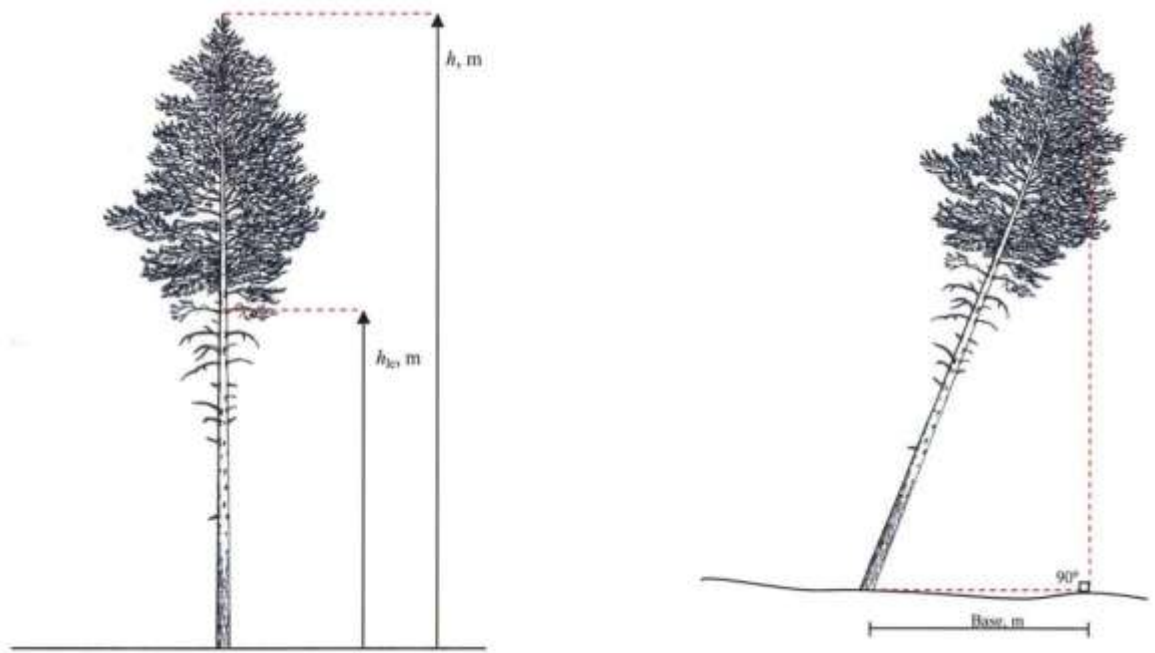

Figure 3. Determination of the total tree height (h , m) and the base of first living crown (h_{LC} , m)

Measurement of dead woods

All dead trees, dead twigs, branches and stems of trees and bush that have fallen and lied on or above the ground and have at least 5 cm diameter at base are measured from the plot with a radius of 10 m with its centre (Form 4). Likewise, all stumps that are within the radius of 10 m from its plot centre are measured and recorded.

In this regard, diameter at tip, diameter at base and length of stumps are measured and recorded (**Field form 4**). Both, downed dead trees and stumps inside the 10 m radius of plot are measured, no matter if the tree has fallen from outside the plot. Dead lying climbers are measured in a similar way.

Deadwood should be measured up to 5cm diameter at tip and thus length (in m.) should also be measured up to 5 cm diameter.

Biodiversity

All biodiversity (ntfp, mammals, climbers, epiphytes, parasites, etc.) observed with in the sample plot area should be listed.

4. Group discussion with farmers and local people

A group discussion should be held at farmers' level on the local uses and importance of trees growing outside forests area.

The following codes should be noted down for each individual uses and importance:

Code #	Use (Plant Products)
1	Animal beddings
2	Beverages
3	Dying/tanning
4	Exudates
5	Fiber and fiber yielding
6	Fodder
7	Fruits and nuts
8	Fumitory and masticators materials
9	Insecticides and herbicides
10	Legumes or pulses
11	Medicinal plants
12	Seeds
13	Soap/cosmetics
14	Spices, condiments and other flavorings
15	Starches and cellulose products
16	Vegetable oils and fats
17	Vegetables
18	Utensils, handicrafts
19	Construction material, Timber
20	Ornamentals
21	Biofuel
22	Support for climber (Thankro)
23	Veterinary medicine
24	Religious plants
25	Furnitures

Annex-I: List of instruments required

SN	Instruments
1	Digital camera
2	Field forms
3	GPS device
4	Pens, pencil, eraser
5	Sheet holder
6	Topographic map
7	Satellite images
8	Spherical densiometer
9	Suunto clinometer
10	Linear tape (50 m)
11	Linear tape (20 m)
12	Diameter Tape
13	Calliper
14	Vertex IV and Transponder T3

Annex-II: Species codes

Species code as used in Forest Resource Assessment (FRA) Nepal

Code	Scientific name	Name	Family	Form	Nepal	Altitude	Local Name
6058	<i>Abies densa</i> w. Griff. Ex parker	Silver Fir	Pinaceae	Tree	E	3000-4000	Gobre Salla
